Contents

1. Introduction
2. Background tGAP structure
3. First implementation
4. Client-server set-up and progressive refinement
5. Conclusions

TU Delft

1. Introduction

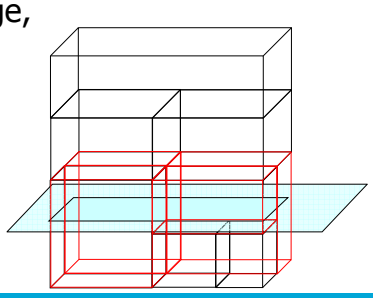
- Multi-scale databases: often multiple representation
  drawbacks: redundancy, fixed levels of detail
- Scaleless data structures: single representation with additional structure to access at any level of detail

- Often also spatial organization (clustering/indexing)
- Progressive transfer: keep sending more details (compare to raster formats: data pyramids, wavelets)

TU Delft

1. Generalized Area Partitioning-tree (GAP-tree) history

- In normal GAP-tree (van Oosterom 1993) areas are stored as independent polygons, drawback (computed) redundancy
- Vermeij et al.'03 proposed topological GAP-tree: edges and faces (with importance range, consider as height), reduced redundancy between neighbors



- Still some redundancy left: coordinates in higher level edge also present in lower (more detailed) level edges

TU Delft

1. tGAP structure (GAP-face tree + GAP-edge forest)

- Also coordinate redundancy between edges at different aggregation levels is removed
- Throughout remainder of presentation examples of the tGAP-structure (creation and use) will be shown
- Creation of the tGAP-tree is shown in pairs of steps
  1. removal of least important face (merge face)
  2. removal of edges, merge of edges (BLG-tree)

TU Delft

1. Proposed solution: tGAP structure

- Variable scale: infinite amount of levels
- Base level with most detailed geometry/topology
- Create links/structure on top

- Only theory → validate
- Last year at Autocarto 2005, presentation was concluded with question: What is the price of non-redundancy, that is, the many references?

- Test and implement structure

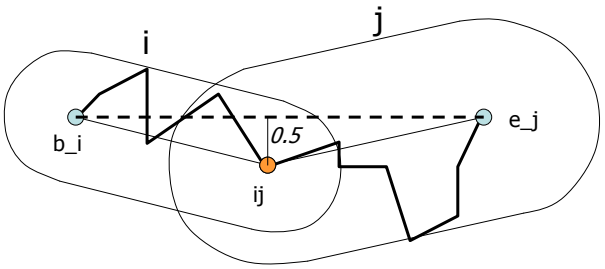
Join BLG-tree's
of edges i and j



err_ij=dist(point(ij), line(b_i,e_j))
+ max(err_i, err_j)=

0.5+0.9=1.4

Contents

1. Introduction
2. Background tGAP structure
3. First implementation
4. Client-server set-up and progressive refinement
5. Conclusions

TU Delft

3. First implementation

- Object-relational model
- Spatial data types available (incl. BLG-tree polyline)
- Tables for tgap_face, tgap_edge, and tgap_blg
- Heavy use of views (and functions) to avoid redundant storage, but to provide 'easy access'
- Functional index (3D R-tree: 2D box+imp range)

- Different from earlier 'theory'
  1. tgap_node table added (last redundancy+BLG-tree)
  2. No winged edge, only left/right refs (less storage)
  3. Signed references when merging BLG-trees

TU Delft

3: tGAP structure: combination of structures

- Uses topology
- Stores results of Generalization
- Suitable for Area Partitioning

GAP face tree	allow face selection
GAP edge forest	allow line selection
BLG tree	allow line simplification
3D R-tree	allow fast selection

TU Delft

3. Constructing GAP face tree
