

Product Survey on Mainstream GIS

This product survey on mainstream GIS gives an overview of the main GIS products currently operational throughout the world. GIM International has invited GIS-software providers to supply product information based on a questionnaire compiled by the present author. The results of the questionnaire are presented on the following pages. In the sequel, some major trends are identified.

By drs. Jantien Stoter, Department of Geodesy, Delft University of Technology

A GIS comprises at least three functional modules:

- ◆ Data storage (database)
- ◆ Spatial analysis of the stored data (the kernel of a GIS)
- ◆ Presentation of (analysed) data, both alpha-numerical and graphical (cartographic interface)

Major developments have recently been made in all the above fields. Spatial analysis functions have been enhanced, visualisations and animations of spatial data (2D and 3D) have been significantly improved and the support of 3D geo-data is becoming increasingly available within GIS products.

GISs are tending to become increasingly DBMS-orientated. More and more GISs are linked with, or based on, a standard Data Base Management System (DBMS) such as Oracle, Ingres or Informix. In addition, these DBMSs are becoming more and more able to manage, besides vector data, also geo-raster data such as images and digital elevation models.

Integrated Architecture

GIS architecture is becoming integrated. This means that geometric data and administrative data are stored together in one DBMS. Within the integrated architecture a DBMS is extended with spatial data types (point, line, polygon) and functions (overlap, distance, area, length). These spatial data types available in the standard DBMSs are becoming increasingly accessible within existing GISs. Integrated architecture may be contrasted to traditional approaches, such as dual architecture (separate DBMS for geometric and administrative data) and layered architecture. In a layered architecture all data is stored in a single DBMS but spatial knowledge is contained between the application and the DBMS. At the same time, database technology is moving from Relational Management (RDBMS) towards Object-Orientated (OO) and Component-Based Developments (CBD). GIS evolution tends to run alongside these recent developments.

Standards

The developments sketched here also induce a need for interoperable geo-processing and an open Geo-Information Infrastructure (GII). Thereby, organisations using GIS and geo-data have an increasing need for exchangeable GIS-functionalities and open (geo)data-formats. In this context, the standards developed by the OpenGIS Consortium are important, as are ISO-standards. GIS-vendors have recognised the importance of these developments by supporting these standards within their products.◆

| Supplier | Autodesk |
|--------------------------------------------------------------------------------------|-----------------------------------------------|
| Brand/Model | iDesign |
| Date of Introduction | 1996 |
| Architecture | |
| Client/server architecture (Y/N) | Y |

ArcInfoVersion 8

GE Smallworld
Core Spatial Technology

Intergraph's
GeoMedia 4.0 product suite

MapInfo MapXtreme

MapInfo Professional

Notes:

- 1) Data Server: Oracle8i/8iSpatial (8.1.6), Application Server: Autodesk Vision, Application Server: Autodesk MapGuide Server, Client: AutoCAD Map, Autodesk MapGuide Client, Autodesk OnSite
- 2) Desktop solution, like AutoCAD Map, AutoCAD Land Development Desktop, etc, in single-seat configuration, Network Licensed-Seats (NLS) configuration or client/server
- 3) Microsoft: 2000 Server, MacOS8.5/9, Solaris2.6 (Autodesk MapGuide) Unix: IBM AIX 4.2, Solaris 2.6, HP/UX 10.20, or digital UNIX 4.0b (Autodesk Vision) Mobile: WinCE2.11, PalmOS (Autodesk OnSite)
- 4) SVGA display req. (single monitor recommended). Min. 800x600 resolution with 256 colors, rec. 1024x786 resolution & 16-bit color; access to CD-ROM drive; mouse or compatible digitiser for input; compatible plotter or printer (optional); sound card (optional)
- 5) Software extensions providing add. application-specific function. Completely integrated with ArcInfo 8 functions and data. The extensions are: ArcSDE, Geostatistical Analyst, Arc Network, ArcTIN, Arc GRID, Arc COGO, ArcScan, ArcExpress, ArcPress, ArcStorm
- 6) Gov. public works management, land information management, transportation management, environmental resource management solutions, bus. GIS, cartography & map prod.
- 7) MapInfo MapMarker for geocoding and address cleansing and Routing J Server for routing with driving directions
- 8) Dep. on type of data/GDO; metadata is maintained within data warehouse or ext. storage
- 9) Versioning control is part of specific industry solutions (government public works management, land information management, transportation management, environmental resource management solutions)
- 10) Single stores up to 7 digits for each coordinate. Double stores up to 15 digits
- 11) Depending on the projection and coordinate bounds of the map
- 12) ArcInfo provides full support for commercial DBMS. SQL tools work directly with DBMSs such as Oracle, INGRES, Sybase, Informix, SQL Server, and Microsoft Access
- 13) The ArcInfo 8 system supports two primary geographic data models: the georelational model (i.e., ArcInfo coverages and ESRI shapefiles with attributes) as well as a new object oriented-data model called a 'geodatabase'
- 14) File based: CAD GDO, MapInfo GDO, ArcInfo GDO: file and DBMS based: MGE GDO
- 15) But not limited to: MS Access, Oracle, Sybase, Centura SqlBase, IBM DB2, Informix, Informix Universal Server, Ingres, MS SQL Server, SOS and SpatialWare
- 16) ODBC or JDBC drivers, or direct Oracle connection
- 17) For the development of new GDO a development kit can be provided
- 18) Native Oracle8i Spatial 8.1.5/8.1.6; SpatialWare for Oracle 8.0.x; Informix; IBM DB2
- 19) The ArcNetwork extension is used to model and analyse spatial networks in the ArcInfo environment. ArcInfo can overlay multiple polygons at one time and support up to 32 polygon coverages in a single overlay operation. The Geostatistical Analyst extension to ArcInfo provides surface modeling and analysis functions
- 20) A view and its component themes are displayed via the Theme Manager menu inter-

face within ArcTools. The Theme Manager maintains the property sheet for each theme that specifies how each theme will be symbolised; controls which themes are drawn and the order in which they are drawn. It also allows users to toggle between 2D and 3D mode

- 21) Automatic digitising of polygons via region growing, raster to vector and vector to raster conversion
- 22) The ArcMap Editor within ArcInfo offers editing capabilities through an interface. The Editor can edit shapefiles, coverages & feature datasets; any type of vector data in the GIS database
- 23) Object manipulation: standard & additional (change, split & merge features; copy, trim & extend feature, insert traverse/areas by face/intersection); validation & correcting; connectivity & geometry; analysing: geometry, queries (thematic, spatial); buffer zones. Note: more functions are available in our industry solutions
- 24) Full suite of raster functionality incl. database query, mathematical operations, statistical measures, neighbourhood operations, cost and distance calculations, decision support, surface analysis, change & time series analysis & image processing and classification
- 25) Subsetting, aggregating, mosaicking, convolution filtering, enhancing, vegetative index, change detection, overlay analysis, classification, categorisation, image rectification
- 26) ARC GRID is a cell-based (raster) GIS that is fully integrated with ArcInfo. True integration of raster and vector data is available in a single geoprocessing system
- 27) Registering raster data; inserting an image; adding images to a map window; adjusting image display; viewing the properties of an image
- 28) ODBC [SQL], COM [Object Components], and CORBA compliance
- 29) ArcInfo supports several metadata standards. Editors to enter metadata, a storage schema and property sheets to view the data. The implementation is compl. customisable and so any metadata format can be implemented. The metadata is stored in XML format.
- 30) CAD support includes AutoCAD .dwg files up to AutoCAD 2000, this includes R13, R14, and 2000. MicroStation .dgn files up to v7, this includes MicroStation 95, SE, and J. All ASCII, binary, and partial drawing interchange files [.dxf] that comply with DXF standards
- 31) Including but not limited to AutoCAD 2000 Drawing exchange file *.dxf, AutoCAD 2000 drawing file *.dwg, Intergraph/MicroStation Design File *.dgn
- 32) Using standard 32-bit development environments such as Visual Basic, C++ and PowerBuilder (MapXtreme: ... and Java development environments such as Symantec Visual Café and Borland J Developer)
- 33) Plus dynamic mapping capability using MapInfo's location-based solutions for the web notably MapXtreme
- 34) No plug-in required (Microsoft Internet Explorer, Netscape Communicator) advanced ActiveX/Java/Plug-In viewers available
- 35) XML using MapInfo's Location-based Solutions for the Wireless Internet notably MapXtend and MapinHand
- 36) The SIAS sample WML client, allows you to pan/zoom on a small black and white map. For WAP supported devices. We fully support WML and WBMP
